A **domain-specific language** (DSL) is a programming language that mimics the terms, idioms and expressions used among the experts in the target domain

- ideally, a domain expert, with no experience in programming, could read, understand and validate such code.

We are used to use domain specific languages (DSLs)

- LaTeX to typeset scientific documents
- SQL to query relational databases
- make \neq ant to build up software systems

... But we don't have the custom to write our own DSL.

Domain Specific Languages

Language-oriented programming

Neverlang

Luca Favalli

DSL benefits are evident

- problem-tailored solutions
 - i.e., solutions more concise and clearer
- domain-oriented solutions
 - i.e., solutions implementable by domain experts

Language-oriented programming

Neverlang

Luca Favalli

DSL Benefits are evident

- problem-tailored solutions
 - i.e., solutions more concise and clearer
- domain-oriented solutions
 - i.e., solutions implementable by domain experts
- **Encapsulation** - a DSL hides implementation details.
- **Productivity** - domain coupling eases the coding phase.
- **Communication** - development is not limited to programmers.
- **Quality** - minor "impedance mismatch" between domain experts' requirements and implementing code.

- **Quality** - minor "impedance mismatch" between domain experts' requirements and implementing code.

... But to implement them is hard!

- to develop a compiler/interpreter is long, complex and requires some skills;
- existing languages cannot be easily extended or modified; and
- there is a lack of tools easing their development

IDE Generation

AIDE

Bottom-up

FeatureIDE

References

Our approach is based on **product line engineering**.
Product Lines are a staple in industrial production.

- A product line is a collection of **features**.
- Each product of the product family is a **variant**.
- Each variant is identified by a subset of all the available features.
- **Product families** emerge as a byproduct of product line development.

Software Product Lines (SPLs) and **Feature-Oriented programming** apply Product Lines concepts to software development.

SPL development can be applied to the creation of language families, hence **Language Product Lines (LPLs)**.

Modularization in Neverlang:

- **modules** are the basic units
- the **reference syntax** represent part of the language grammar
 - it is comprised of a set of production rules
- each **role** represents a phase of the compilation process
 - it represents the language **semantics**
- a **slice** regards a particular language **feature** (construct)
 - it is the composition of a reference syntax with their roles

Grammar Centric Approach!

Syntax is used for selecting insertion points, where semantic actions are plugged in to form slices:

- nonterminals correspond to insertion points
- semantic actions at nonterminals correspond to code to be executed during the AST visit

A syntax-driven translation mechanism.

Aho, Lam, Sethi and Ullman 1986 [1]

...and several concrete syntax implementations.

```
module InfixAdditionSyntax {  
  reference syntax {  
    AddExpression ← AddExpression "+" Term;  
    AddExpression ← Term;  
  }  
}
```

```
module InfixMultiplicationSyntax {  
  reference syntax {  
    MulExpression ← MulExpression "*" Factor;  
    MulExpression ← Factor;  
  }  
}
```

Neverlang

Feature and Language Implementation

Neverlang

Luca Favalli

Language Features are implemented through composition.

Composition is twofold:

1. Between roles, which yields slices (language features)

```
slice InfixAddition {  
    concrete syntax from InfixAdditionSyntax  
    module AdditionSemantics with role evaluation  
}
```

2. Between slices, which yields languages (compilers/interpreters)

```
language InfixLang {  
    slices  
        InfixAddition  
        InfixMultiplication  
        ...  
    roles syntax < evaluation  
}
```

The semantic actions could require some supporting code:

- ancillary structures are defined in the **endemic slices**;
- fields and methods defined in an endemic slice are accessible by all the others modules.

```
endemic slice FileOpEndemic {  
  declare {  
    FileOp : neverlang.examples.loglang.utils.FileOp;  
  }  
}
```

```
role(execution) {  
  bkp: .{  
    String src = $bkp[1].string;  
    String dest = $bkp[2].string;  
    $$FileOp.backup(src, dest);  
  }.

To add a **Merge** operation to the language:

- a new slice for the operation should be created;
- one of its nonterminals must be present in the rest of the grammar definition (a sort of anchor)

Neverlang

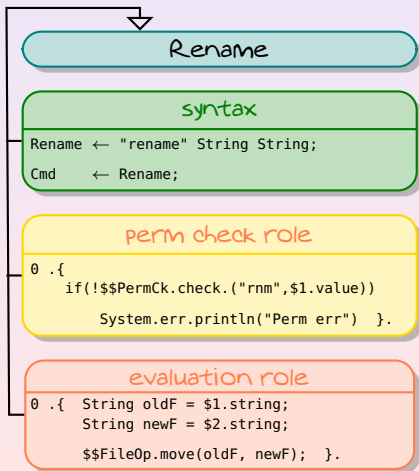

Language Extension

Neverlang

Luca Favalli

To add an additional permission check:

- a new phase in the interpretation process should be defined
- to enrich each slice with a module to be used in the new phase.

DSLs and languages in general need **Integrated Development Environment (IDE)** support.

- syntax highlighting;
- auto-completion;
- debugger.

Working with LPLs means that an IDE must be developed from scratch for each new language variant.

In Neverlang, IDE specifications are bundled with module definitions.

- Better encapsulation;
- improved module reusability;
- the IDE for a language variant is automatically generated.

Kühn, Cazzola, Pirritano and Poggi 2019 [5]

The screenshot displays the AiDE/FeatureIDE IDE interface. On the left, a code editor shows the definition of the `JSAssignmentExpression` module, including its imports, reference syntax, and categories. The top right pane shows a feature diagram for the `neverlangJS` model, illustrating the relationships between various features like `expression`, `statement`, `endemics`, and `functions`. The bottom section features a variant manager with a table for managing configurations:

Configuration	Advanced Configuration	Source	Roles	Renames	Neverlang source
Variant00b.nl	valid, more than 1545 possible config:				
Variant04.nl	Features Auto-Selection		1/1 Renamed open Non-Terminals		

Below the variant manager, several code snippets are shown, including a factorial function definition and its execution results for different inputs. The console at the bottom displays the output of running a variant configuration.
